

## Why should students study the common properties of things?

Any property which can be found in more than one thing is a common property. *Any property which cannot be found in more than one thing is a special property.*

The knowledge of the common properties can be applied on more than one thing because a common property can be found in more than one thing. *The knowledge of a special property cannot be applied on more than one thing because a special property cannot be found in more than one thing.*

Everyone who has the knowledge of common properties would have the confidence and skill to study more than one thing. *Everyone who does not have the knowledge of common properties would not have the confidence and skill to study more than one thing.*

Everyone who has the knowledge of common properties can illustrate students how the knowledge of common properties can be applied to initiate studies on things which are yet to be studied.

*Everyone who does not have the knowledge of common properties cannot illustrate students how the knowledge of common properties can be applied to initiate studies on things which are yet to be studied.*

The list of common properties can be found in Analytical Wiki at: <http://analytical.wikia.com>
